

D Differential expression: Control vs. Tumor

Paper axes and blue/red direction; current tissue × cluster comparisons

Common axes: $|\log_2\text{FC}| \leq 5$; $-\log_{10}(P)$ capped at 100. All uncapped values and display flags are exported.

Color rule retained: gene BH FDR ≤ 0.05 and $|\log_2\text{FC}| \geq 0.25$. Vertical display thresholds are therefore ± 0.25 .
